

Internship Project Report

Topic: Wireframing for a FinTech App
Name: Sagar Kumar
Intern ID: CITS2918

1. Introduction

Wireframing is the process of creating a low-fidelity blueprint of an application before UI design and development. In a FinTech application, wireframes help define navigation, user flow, security features, payments, and financial dashboards.

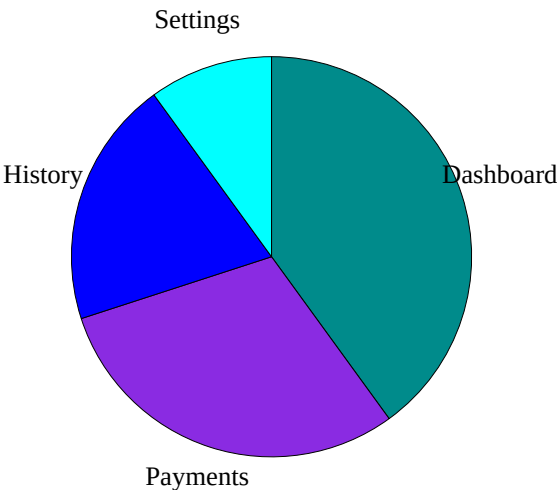

2. Objectives

Objective	Description
User-friendly UI	Simple navigation
Security	OTP, Biometric Login
Transactions	Fast money transfer
Analytics	Expense tracking

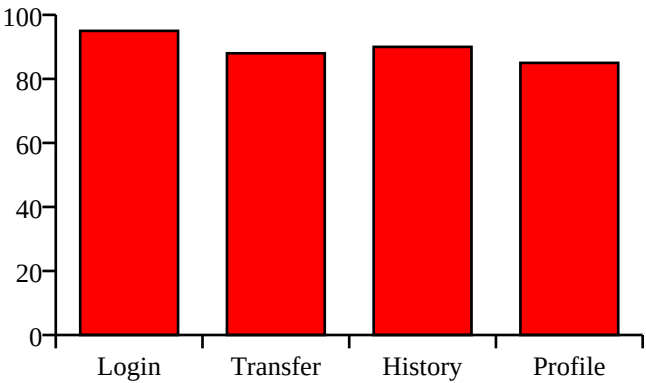

3. Wireframe Structure

- Screen 1: Login/Signup
- Screen 2: Dashboard (Balance, Cards, Quick Actions)
- Screen 3: Send Money
- Screen 4: Transaction History
- Screen 5: Profile & Settings

4. Charts and Analysis

Pie Chart: Estimated user interaction across major sections.

Bar Chart: Sample usability testing scores.

5. Conclusion

A well-designed wireframe improves usability, reduces development cost, and ensures a secure and intuitive financial application. Recommended tools include Figma, Adobe XD, and Balsamiq. Future enhancements include AI budgeting, biometric authentication, QR payments, and investment tracking.
